FAQ

•`strsubstring(str, x, y)`: Returns a substring of the string `str` starting at position `x` and ending at position `y`.

•`strrightstring(str, x)`: Returns a right-trimmed string of `str` with its leading characters removed. •`strleftstring(str, x)`: Returns a left-trimmed string of `str` with its trailing characters removed. •`strbefore(str, str)`: Returns a copy of `str` with the first `N` characters removed. •`strafter(str, str)`: Returns a copy of `str` with the last `N` characters removed. •`strincrease(str, x)`: Returns a copy of `str` with `x` characters added at the end. •`strincrease(str, x, y)`: Returns a copy of `str` with `y` characters added at the end.

•`strleft(str, len)`: Returns a copy of `str` with the first `len` characters removed. •`strright(str, len)`: Returns a copy of `str` with the last `len` characters removed. •`strcompare(str1, str2)`: Returns 0 if the two strings are identical, -1 if `str1` < `str2`. •`strclamp(str, minlength, maxlength)`: Returns a copy of `str` with the leading and trailing characters removed if their lengths exceed `minlength` or `maxlength`, respectively. If `minlength` or `maxlength` is equal to 0, then the strings are kept unchanged. •`strnullstring(str)`: Returns the empty string. •`strjoin(str, sep)`: Returns a string formed by concatenating `str1`, `str2`, `str3`, and so on with `sep`, separated by `str`, or the empty string if `sep` is null. •`strsplit(str, sep)`: Returns a string containing the parts of `str` separated by `sep`. If `sep` is null, then the parts are separated by one or more spaces or tab characters. •`strmatch(str, pattern)`: Returns the smallest integer `i` such that `str` matches the regular expression pattern, starting at `str[i]`. •`strextract(str, pattern)`: Returns the substring in `str` that matches pattern. •`strinplace(str, pattern, substitute)`: Removes all occurrences of the first argument, pattern, in the string `str` and replaces them with the second argument, substitute 82157476af
